

## OPERATING LIMITS

Flows rates up to:	60 m <sup>3</sup> /h
Heads up to:	17 m CE
Max. operating pressure:	10 bar
Temperature range:	-20° to +110°C
Max. ambient temperature:	+40°C
ND of ports:	25 to 100
EEI single pump:	≤0,23
EEI double pump:	≤0,27

The benchmark for most efficient circulators  
is EEI ≤ 0,20

## ADVANTAGES

- Energy savings
- All-purpose
- Noise reduction
- Reliability
- Ergonomics

# PRIUX MASTER

## SINGLE AND DOUBLE HIGH EFFICIENCY CIRCULATORS STANDARD RANGE

### Heating - Air-conditioning

## APPLICATIONS

For accelerated water circulation for heating or cooling, with optimization of circulator operating point.

- Central heating,
- Urban heating,
- Commercial or industrial installations;
- Cooling circuits.

- Air-conditioning systems
- New, old (renovated) installations or extensions.

Circulating pumps recommended for facilities fitted with thermostatic valves.

Constant speed : feature available in the course of 2015, on the whole range.

# PRIUX MASTER

## DESIGN

### • Hydraulic part

Single or double body with threaded or flanged. 3D impellers and spiral for maximum optimization of the hydraulic performances. An impeller seal between the pump body and the impeller improves performances further by limiting the internal recycling of the fluid. The pump body is fully cataphoresis coated to ensure corrosion resistance.

### • Motor

230 V – 50 - 60 Hz single-phase  
Wet rotor motor; bearing bushes lubricated by the fluid pumped.  
E.C.M. (Electronically Commutated Motor) synchronous motor, equipped with a permanent magnet rotor.  
The stator's rotating magnetic field is generated by the electronic switching of the coils.  
This rotating field creates a continuous torque through attraction between the rotor's opposite magnetic poles, controlling its position (synchronous motor). This ensures the optimum performance of the motor, whatever its speed.  
The wet rotor and the windings are separated by a composite, and therefore completely amagnetic, sleeve, to reduce motor losses.

### SXE with AC motor

### Priux with EC motor

Speed:	800 to 4800 rpm
Mains voltage:	1-ph. 230 V ± 10 %
Frequency:	50 Hz - 60 Hz
Insulation class:	F (155° C)
Protection index:	IPX4D
EMC compliance:	EN 61800-3 emission EN 61000-6-3 immunity EN 61000-6-2

### • Protection differential (FI)

«All current» FI protection differentials compliant with EN 61008-1 are permitted. These differential circuit breakers are identified by or

## ADVANTAGES

### • Energy savings

High efficiency circulators, with optimization of the operating point. Energy savings of up to 80% compared to a traditional circulator.

### • All-purpose

These circulators are compatible with all types of heating, air-conditioning and refrigeration systems. The standard version covers a fluid temperature range from -20°C to +110°C.

### • Noise control

Eliminating of whistling and hydraulic noises in the thermostatic valves. Automatic adapting of speeds to the system's needs.

### • Reliability

Fully automatic operation requiring neither venting nor servicing. A double filter system prevents solid particles from getting into the rotor chamber. A rotating seal between the impeller and the endshield limits water exchanges with the motor to the bare minimum.

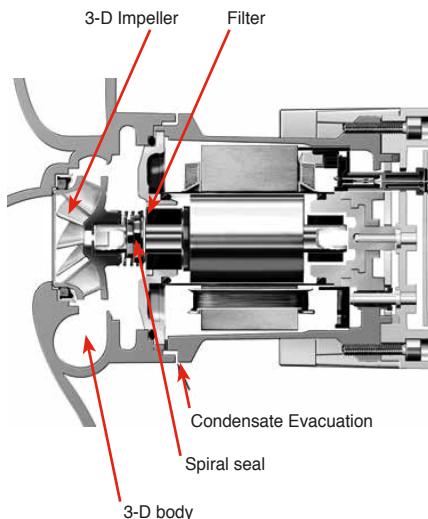

### • Ergonomics

The control module of the Priux master is freely accessible. One single button is used for the selection of the operating mode and the setting of the delivery head setpoint. A plug is used for the electrical connection. It is possible to remove the plug from the module and open it. Thus the electrical connection can be done in an easy and safe way.

### Pressure gauge tappings on the flanges.

## STANDARD CONSTRUCTION

Main parts	Material
Pump casing	EN GJL 250
	EN GJL 200 for ND 25-32
Impeller	Glass fibre reinforced PPS
	PPE for ND 25-32
Shaft	Chromium steel (X46 – Cr13)
Bearing bushes	Metal impregnated carbon

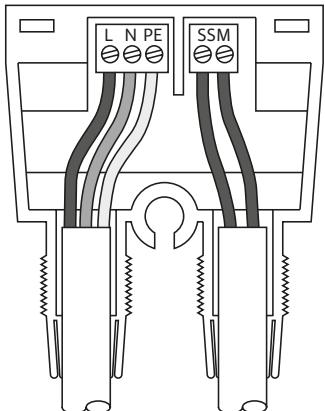

## IDENTIFICATION

Priux master 32 - 65
Priux master D
High efficiency _____
circulator
Single pump _____
or D : double pump
Nominal diameter (ND) _____
of suct/dis. flanges
Head (in dm) _____
at nominal flow

## CONNECTIONS

The electrical connection is done in the connector which can be removed from the electronic module

### • Connector

### • terminal

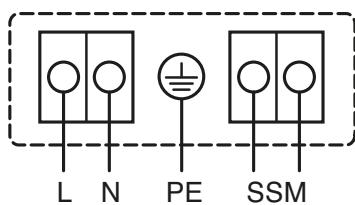

**L – N:** mains connection, 230 V – 50 Hz – 60 Hz single-phase current

**PE:** earth

**SSM:** dry contact for fault indicator (normal closed, open by default). Max load: 1 A – 250 V – AC

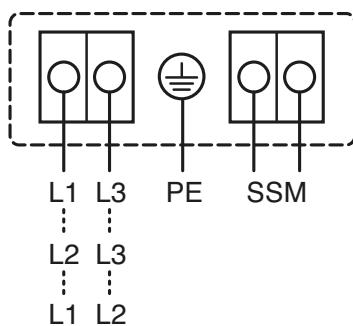

### • Main connection

1~ 230 V, 50/60 Hz

Connection to a 1~230V network

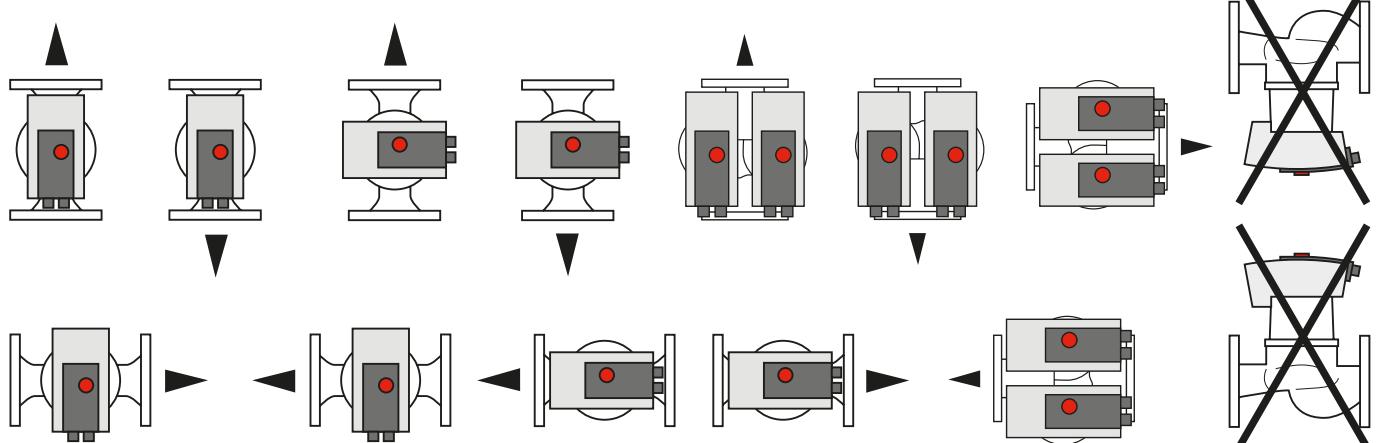

3~230 V, 50/60 Hz

Or between two phases of a 3~230V network

## POSSIBLE ASSEMBLY

On vertical or horizontal pipes the motor shaft must always be horizontal.

## OPERATING PRINCIPLE

The heating or air-conditioning needs of a building vary according to whether it is day or night, but also during the day according to changes in the outside temperature, etc., and even from one point of the building to another as the thermostatic valves or 2-way valves are closed. The self-regulated circulator automatically adjusts its rotation speed according to the mains network's friction losses, in order to maintain a minimum electricity consumption (ECM technology) and a low operating noise level. The circulator's properties are adjusted automatically according to the heating or cooling needs of the system.

### • Manual adjustment

Parameterization of basic functions, i.e.:

- control mode  $\Delta P$  constant  $\Delta P$  variable
- pressure setpoint adjustment
- speed selection.

### • Constant pressure

With this regulation mode, electronic control maintains the constant differential pressure of the circulating pump whatever the flow rate, depending on the predefined pressure value.

### • Variable pressure

With this regulation mode, the electronic control allows reducing the differential pressure (manometric head) in case of flow reduction, depending on the predefined differential pressure value.

### • Speed selection (rated power $P \geq 600W$ )

The rotation speed can be adjusted manually on 3 predefined constant values (depending on models).

### • Remote monitoring (SSM)

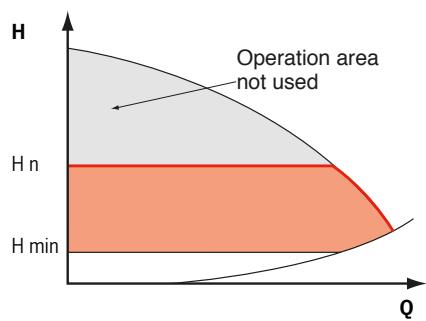

In addition, a dry contact (open by default) allows the remote monitoring of any operating incident (e.g. through a building management system).

### • Double circulators (or two single pumps installed in parallel)

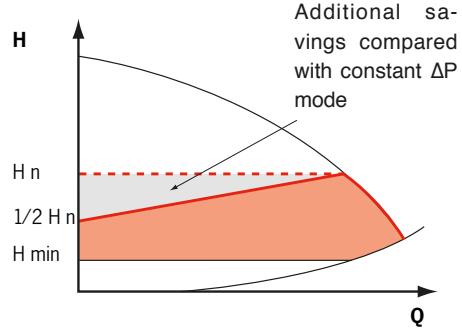

The Duty/Stand-by operation mode is allowed.  
For an automatic fault-actuated switchover, a switchgear using the collective fault signal available on the pump (SSM) is required on site. Parallel operation is not permissible, since the pumps can interfere with each other's operating behaviour.

## OPERATING PRINCIPLE

### $\Delta P$ Constant Mode

### $\Delta P$ Variable Mode

Electronic module maintains constant the differential pressure produced by the pump at the differential pressure value of  $H_n$  instruction, up to the curve of operating data through the authorized flow rating.

Electronic module modifies linearly the differential pressure value between  $H_n$  and  $1/2 H_n$  instruction to be met by the pump. Differential pressure value of  $H$  instruction increases or decreases acc. to the requested flow rate.

## TABLE OF FUNCTIONS

	Priux master	Priux master-D
<b>Operating modes</b>		
Speed selection ( n = constant)	P2≥600W	P2≥600W
Δp-c for constant differential pressure	•	•
Δp-v for variable differential pressure	•	•
<b>Manual functions</b>		
Adjustment of operating mode	•	•
Adjustment of differential-pressure setpoint	•	•
Adjustment of speed (manual setting mode)	3 predefined values	3 predefined values
<b>Automatic functions</b>		
Smooth adjustment of power depending on the operating mode	•	•
Deblocking function	•	•
Soft start	•	•

# PRIUX MASTER

## MIN. SUCTION LOAD

### • Priux master

Minimum suction head at suction port [m] for preventing cavitation at water pumping temperature

	25-55	25-65	25-90	32-55	32-65	32-90	40-30	40-60	40-80	40-110	50-60	50-70	50-80	50-110	65-80	65-90	65-110	80-40	80-90	100-90

110°C	16	16	18	18	23	18	18	23	23	23	23

## FEATURES

### a) Packaging

Threaded models: supplied with gaskets without unions.

Flanged models: supplied with flange seals and bolts, without counterflanges (optional).

### b) Maintenance

Replacing of motor unit.

## RECOMMENDED ACCESSORIES

- Unions and PN 10/16 weldable round counterflanges
- Insulation shell (heating application)
- Adaptation fittings.
- Isolation valves
- Kit press 6.
- MGP / YN 1200 control box.
